## EXECUTIVE SUMMARY

This is a plain-language transparency report for the r3tards NFT collection on Monad. The goal is simple: show the real on-chain numbers so the community can see what was collected, what was actually received, and what was committed back to the ecosystem - and verify all of it independently.

Three separate audits were run against public on-chain data and indexed API outputs: a mint-proceeds audit, a royalty audit, and a validator-stake audit. Collection supply, official wallets, and community burn proofs are documented alongside them. The headline figures are summarized below.

| Metric                                | Value                                                     |
|---------------------------------------|-----------------------------------------------------------|
| Total supply                          | 1,033 NFTs                                                |
| Current supply (at snapshot)          | 1,031 NFTs                                                |
| Mint proceeds collected (gross MON)   | 288,045 MON                                               |
| Royalties actually received (matched) | 78,483.61 MON                                             |
| Deployer-specific validator stake     | 281,946 MON                                               |
| Locked team supply contract           | 35 NFTs held by lock contract; source/test evidence added |
| Snapshot block                        | 77,822,541                                                |

**In one line: the collection collected 288,045 MON of gross mint proceeds, the royalty/deployer wallet actually received about 78.5K MON in matched royalties, and the deployer has committed about 282K MON of personal stake into the Monad ecosystem via the forthenads validator. These are three different things and the report keeps them separate.**

## WHY THIS AUDIT EXISTS

---

NFT founders and artists are asked to do a lot. They fund the project up front, build the art and the tech, reward holders, keep the culture alive, and keep operations running long after mint day. That work does not stop when the collection sells out.

At the same time, creator royalties on most chains and marketplaces are now optional or simply not enforced. That means the royalties a collection actually receives can be far lower than what holders, marketplaces, or the original 'royalty rate' might suggest. The gap between what is owed in theory and what arrives in the wallet is real.

This report does not try to hide that gap or dress it up. It separates the hype from the receipts:

- Mint proceeds - 705 direct paid mints plus 160 router/internal paid mints, totaling 288,045 MON gross value. This is gross value, not profit.
- **Royalties actually received** - real inbound MON / WMON matched to r3tards secondary-sale activity, not a theoretical entitlement.
- **Validator stake** - MON committed to the Monad ecosystem through the forthenads validator. This is a commitment, not creator earnings.

If founders, artists, and communities are expected to keep building, then both creator revenue and transparency matter. This document is an attempt to be honest about both.

## COLLECTION OVERVIEW

| Field                             | Detail                                     |
|-----------------------------------|--------------------------------------------|
| <b>Collection</b>                 | r3tards NFT                                |
| <b>Chain</b>                      | Monad                                      |
| <b>NFT contract</b>               | 0x200723A706de0013316E5cd8EBa2b3f53DD90c29 |
| <b>Total supply</b>               | 1,033                                      |
| <b>Current supply at snapshot</b> | 1,031 (2 NFTs burned by community members) |
| <b>Start block</b>                | 67,220,770                                 |
| <b>Snapshot block</b>             | 77,822,541                                 |
| <b>Validator</b>                  | forthenads (ID 154)                        |

### Official wallets

These are the official project wallets documented in the repository (collection-info/collection-info.json). Bold labels indicate the wallet role.

| Wallet                               | Address                                    | Note                                                                               |
|--------------------------------------|--------------------------------------------|------------------------------------------------------------------------------------|

## MINT PROCEEDS

This section summarizes the reconciled mint proceeds calculation for r3tards NFTs. The public mint proceeds figure is supported by direct tx value and internal transfer evidence in the mint-proceeds audit outputs.

### MINT PROCEEDS COLLECTED

288,045 MON

865 non-free NFTs minted at 333 MON each. This is gross value, not profit.

### NON-FREE MINTED NFTS

865

Minted at 333 MON each

### FREE-MINTED NFTS

168

Project-level free mint count

## The numbers explained

| Metric                   | Value       | What it means                                         |
|--------------------------|-------------|-------------------------------------------------------|
| Mint events from zero    | 1,033       | NFTs minted (transfers from the zero address).        |
| Unique mint transactions | 673         | Distinct transactions that minted at least one NFT.   |
| Mint proceeds collected  | 288,045 MON | 865 non-free NFTs × 333 MON.                          |
| Mint price               | 333 MON     | Price per non-free minted NFT.                        |
| Non-free minted NFTs     | 865 tokens  | Project-level count of NFTs minted at the mint price. |
| Free-minted NFTs         | 168 tokens  | Project-level count of NFTs minted for free.          |
| Unique senders           | 542         | Distinct wallets that sent mint transactions.         |
| Unique recipients        | 642         | Distinct wallets that received minted NFTs.           |

## Withdrawals from the NFT contract

Mint classification: 705 direct paid mints and 160 router/internal paid mints are proven by transaction/internal transfer evidence; 168 free mints have no native payment trace in committed evidence.

The audit also tracked native MON moved out of the NFT contract via internal transactions. In total 288,045 MON was withdrawn from the contract: 273,642.75 MON went to the deployer wallet and 14,402.25 MON went to the ArchetypePayouts / mint infrastructure payout contract. The contract's remaining native balance at snapshot was 0 MON.

| Withdrawal                                            | Amount         |
|-------------------------------------------------------|----------------|
| <b>Total withdrawn from NFT contract</b>              | 288,045 MON    |
| → withdrawn to deployer wallet                        | 273,642.75 MON |
| → withdrawn to ArchetypePayouts / mint infrastructure | 14,402.25 MON  |

| Withdrawal                              | Amount |
|-----------------------------------------|--------|
| payout contract                         |        |
| NFT contract native balance at snapshot | 0 MON  |

**Important:** mint proceeds are gross value, not profit. They do not subtract gas, refunds, infrastructure, art, marketing, or any other project costs.

## MATCHED LIKELY ROYALTIES RECEIVED

Royalties are not enforced for this collection. So instead of estimating what royalties should have been paid under ERC-2981 or a marketplace setting, this audit reports matched likely royalties: inbound MON and WMON payments to the royalty/deployer wallet that share a transaction with a secondary r3tards NFT transfer. This is strong evidence of received value, but it is still a heuristic attribution method, not definitive marketplace royalty-enforcement proof.

### ROYALTIES ACTUALLY RECEIVED (MATCHED)

78,483.61 MON

Total MON-equivalent across 241 matched royalty transactions. WMON is counted 1:1 with MON.

#### NATIVE MON (INTERNAL)

55,533.01 MON

Native internal transfers

#### WMON

22,950.60 WMON

Wrapped MON, counted 1:1

## Breakdown

| Source                          | Amount     | Notes         |
|---------------------------------|------------|---------------|
| WMON received                   | 22,950.598 | 1:1 MON-equiv |
| Native MON (internal transfers) | 55,533.012 | Native        |
| Native MON (direct transfers)   | 0          | None matched  |
| Total matched royalties         | 78,483.61  | MON-equiv     |

## Matching method, in plain terms

| Counter                                     | Value |
|---------------------------------------------|-------|
| Indexed inbound payments examined           | 272   |
| Payments matched to r3tards NFT activity    | 241   |
| Payments ignored (no matching NFT transfer) | 31    |

A payment is counted as a matched likely royalty only if the inbound MON / WMON transfer shares a transaction hash with a secondary ERC-721 transfer from the r3tards contract. The 31 ignored payments were inbound transfers that did not line up with a collection NFT transfer - for example, the large contract withdrawal and other unrelated inbound MON - so they are deliberately excluded from the royalty total.

**Important: this is matched received value, not a theoretical royalty entitlement and not definitive marketplace attribution. Because royalties are not enforced, any sale where the buyer or marketplace chose not to pay simply never arrives in the wallet - and therefore cannot appear in this report. The 78,483.61 MON figure is the inbound MON/WMON value that landed in the wallet and matched r3tards secondary-transfer activity under the same-transaction heuristic.**

## VALIDATOR STAKE: FORTHENADS

The deployer wallet delegates MON to the forthenads validator (ID 154) on Monad. This section is kept deliberately separate from revenue. Staking MON with a validator is an ecosystem commitment - it is locked into Monad's consensus, not income earned by the project.

### Whole-validator state (forthenads)

These numbers describe the entire validator, which includes stake from many independent delegators - not just the r3tards deployer.

| Validator metric                         | Value             |
|------------------------------------------|-------------------|
| Snapshot stake                           | 99,762,221.33 MON |
| Consensus stake                          | 99,752,286.82 MON |
| Execution stake                          | 99,540,162.70 MON |
| Unclaimed rewards (validator)            | 93,799.68 MON     |
| Commission (exec / consensus / snapshot) | 15%               |
| Epoch                                    | 1557              |

### Deployer-specific stake

This is the portion delegated specifically by the r3tards deployer / royalty wallet (0x40Ea...47fA) to the forthenads validator.

|                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>DEPLOYER CURRENT STAKE (FORTHENADS)</b></p> <p>281,946.17 MON</p> <p><i>Net stake currently delegated by the deployer wallet to validator ID 154.</i></p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Deployer staking metric             | Value          |
|-------------------------------------|----------------|
| Current stake                       | 281,946.17 MON |
| Gross delegated (by events)         | 317,501.17 MON |
| Gross undelegated (by events)       | 35,555 MON     |
| Net delegated (by events)           | 281,946.17 MON |
| Delegate events / undelegate events | 5 / 1          |
| Unclaimed rewards (deployer)        | 297.18 MON     |

**Important:** validator stake is not project revenue. The ~99.76M MON whole-validator figure belongs to many delegators across Monad, not to r3tards. The ~281,946 MON deployer stake is MON committed to the Monad ecosystem and locked into validator operations - not creator earnings. A per-delegator sum for the whole validator was not collected in this run, so it is reported as Not available.

## SUPPLY, BURNS & COMMUNITY PROOF

The r3tards collection has a total supply of 1,033 NFTs. At the audit snapshot the current supply was 1,031, because 2 NFTs were burned by community members. Both burns are documented with on-chain transactions and independent community proof.

| TOTAL SUPPLY                                | CURRENT SUPPLY                                      |
|---------------------------------------------|-----------------------------------------------------|
| 1,033 <b>NFTs</b><br><i>Minted lifetime</i> | 1,031 <b>NFTs</b><br><i>After 2 community burns</i> |

### Community burn proofs

Each burn below links to the r3tardbot report, an independent community-member proof, and the MonadScan transaction.

| Burn | r3tardbot report          | Community proof       | Transaction     |
|------|---------------------------|-----------------------|-----------------|
| #1   | r3tardbot status 20488... | @AlexxDumii proof     | 0x6e8d...b18032 |
| #2   | r3tardbot status 20585... | @andalfthegreat proof | 0x465c...35edc7 |

Full transaction hashes are listed in the Appendix.

## METHODOLOGY

---

All three audits run against public Monad on-chain data and indexed API outputs, and save their raw and summarized results into the repository. Each audit can be re-run from its script. Headline figures in this report are taken from each audit's summary.json file; CSV files were used to verify those figures.

### Mint proceeds audit

- Reads ERC-721 mint Transfer events from the zero address for the r3tards contract.
- For each mint transaction, checks the attached native MON value and whether the transaction went directly to the NFT contract or via another contract/router.
- Tracks native MON withdrawn from the NFT contract using indexed internal transactions.
- Script: `audit-mint-proceeds.mjs`

### Royalty audit

- Reads inbound MON and WMON payments to the royalty/deployer wallet via an indexed API.
- Counts a payment as a royalty only if it shares a transaction hash with a secondary ERC-721 transfer from the r3tards contract.
- Treats WMON as 1:1 with MON. Does not estimate royalties from ERC-2981 - only actual received and matched value is counted.
- Script: `audit-monad-royalties-indexed-api.mjs`

### Validator stake audit

- Reads validator and delegator staking state from the Monad staking precompile, plus delegate / undelegate event history.
- Separates the whole-validator stake from the deployer-specific delegated stake.
- Script: `audit-validator-stake.mjs`

### Collection info

- Documents official wallets, total/current supply, the locked team-supply contract, and community burn proofs (collection-info.json and supply-wallets-and-burns.md).

Cross-check note: mint proceeds reconcile to 288,045 MON: 234,765 MON direct plus 53,280 MON router/internal. The likely-royalties CSV sums to 78,483.61 MON across 241 matched rows.

## LIMITATIONS

This report is honest about what it can and cannot show. Please read these limitations alongside the numbers.

- Indexed APIs can have indexing delays, so very recent activity may not be fully captured.
- The snapshot is accurate only up to the stated snapshot block (77,822,541). Supply and stake can change after this point - for example, if future burns occur.
- The royalty figure measures inbound payments that reached the wallet and matched r3tards activity under a same-transaction heuristic. Unpaid royalties that never arrived cannot appear here. Because royalties are unenforced, the true 'owed' amount may be higher than the matched received amount, and exact marketplace attribution is outside this report's proof boundary.
- Mint proceeds are gross value, not profit. They do not subtract gas, refunds, infrastructure, art, marketing, or any other project costs.
- Native and internal transfer detection depends on available indexed / internal transaction data.
- A per-delegator stake sum across the whole validator was not collected in this run (delegator enumeration disabled), and is reported as Not available.
- This report is informational. It is **not legal, financial, accounting, or tax advice**.

## ▪ COMMUNITY NOTE

This report is not about pretending everything is perfect. It is about showing the numbers clearly. If founders, artists, and communities are expected to keep building, then creator revenue and transparency both matter.

The goal is to make the r3tards NFT financial picture easier for the community to understand – and easier for anyone to verify on-chain.

Gmonad and thanks for reading r3tards!

## APPENDIX

## A. Contract & key addresses

[illegible]

## B. Snapshot & chain parameters

| Parameter       | Value               |
|-----------------|---------------------|
| Chain           | Monad (chainId 143) |
| Start block     | 67,220,770          |
| Snapshot block  | 77,822,541          |
| Validator       | forthenads (ID 154) |
| Validator epoch | 1557                |

#### D. Repository structure

| Folder                         | Purpose                                |
|--------------------------------|----------------------------------------|
| r3tards-mint-proceeds-audit/   | Mint proceeds audit script + outputs   |
| r3tards-royalty-audit/         | Royalty audit script + outputs         |
| r3tards-validator-stake-audit/ | Validator stake audit script + outputs |
| collection-info/               | Supply, wallets, locked supply, burns  |

## E. Scripts

| Script                                       | Run command   | Audit     |
|----------------------------------------------|---------------|-----------|
| <b>audit-mint-proceeds.mjs</b>               | npm run mint  | Mint      |
| <b>audit-monad-royalties-indexed-api.mjs</b> | npm run api   | Royalty   |
| <b>audit-validator-stake.mjs</b>             | npm run stake | Validator |

## F. Data sources used

Every figure in this report traces back to one of the following files. summary.json files were used for headline numbers; CSV/JSON detail files were used for verification and supporting detail.

| File                                                     | Used for                                     |
|----------------------------------------------------------|----------------------------------------------|
| <b>mint-proceeds-output/summary.json</b>                 | Mint headline numbers (source of truth)      |
| mint-proceeds-output/mint_events_from_zero.csv           | Mint event detail                            |
| mint-proceeds-output/mint_txs_with_native_value.csv      | Verify gross / direct value                  |
| mint-proceeds-output/withdrawals_from_nft_contract.csv   | Withdrawal breakdown                         |
| <b>royalty-audit-v4-output/summary.json</b>              | Royalty headline numbers (source of truth)   |
| royalty-audit-v4-output/likely_royalties.csv             | Verify matched royalty total                 |
| royalty-audit-v4-output/all_indexed_inbound_payments.csv | Inbound payment detail                       |
| royalty-audit-v4-output/ignored_inbound_payments.csv     | Ignored / unmatched payments                 |
| <b>validator-stake-output/summary.json</b>               | Validator headline numbers (source of truth) |
| validator-stake-output/validator_state.json              | Whole-validator stake detail                 |
| validator-stake-output/specific_delegator_state.json     | Deployer-specific stake                      |
| validator-stake-output/*delegation_events.csv            | Delegate / undelegate history                |
| <b>collection-info/collection-info.json</b>              | Supply, wallets, burns (source of truth)     |
| collection-info/supply-wallets-and-burns.md              | Supply & burn narrative                      |

**Security note:** the repository was scanned for secrets. No API keys, private keys, or tokens are hardcoded. The audit scripts read keys from environment variables, and the .env.example files contain only the placeholder "YOUR\_ETHERSCAN\_API\_KEY" - nothing sensitive was included in this report.

## G. Lock contract source and tests

The repository now includes the provided NFTTimeLock source, deterministic Foundry tests, and recorded test output for the locked/team supply contract. **This strengthens the lock documentation while keeping custody proof and source/test proof separate.**

| Item                       | Evidence                                                                                                                                              |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lock contract address      | 0xec823eAffA4584f482a0d9c3E634840d14066242                                                                                                            |
| Current lock custody proof | 35 NFTs verified as owned by the lock contract at snapshot block 77,822,541                                                                           |
| Source file                | r3tards-locked-supply-audit/contracts/NFTTimeLock.sol                                                                                                 |
| Test file                  | r3tards-locked-supply-audit/test/NFTTimeLockTest.t.sol                                                                                                |
| Foundry test result        | 31 passed, 0 failed, 0 skipped                                                                                                                        |
| Test gist                  | <a href="https://gist.github.com/dreiki-nft/20fb15e674c2439e26f0f302a70edaa6">https://gist.github.com/dreiki-nft/20fb15e674c2439e26f0f302a70edaa6</a> |

**Source-level rules documented:** the provided contract stores four owner addresses, stores the NFT contract in the constructor, sets unlockTime to deployment timestamp plus 3 years and 1 day, and restricts withdrawNFT / withdrawMultipleNFTs with onlyOwner and onlyAfterUnlock.

**Proof boundary:** the source and tests prove the behavior of the provided source. The token custody proof verifies that the lock contract holds 35 NFTs at the snapshot. The deployed-state read documents unlockTime/owners/nftContract when present, but exact deployed bytecode/source equivalence is not proven by this report. The repo now includes lock\_bytecode\_verification.json to make that boundary explicit.

**Read-only command:** `cd r3tards-locked-supply-audit && npm install --ignore-scripts && RPC_URL="https://rpc.monad.xyz" SNAPSHOT_BLOCK=77822541 npm run fetch:state`

## H. Reproducibility and proof-boundary hardening

Checksum integrity: data/checksums.json now includes README, claim-status/data-dictionary files, report files, lock proof artifacts, and key raw/derived outputs. `npm run validate` recomputes SHA256 hashes and fails on mismatch.

Deterministic rebuilds: generated audit outputs now use the canonical generatedAt value from config.json instead of wall-clock time, so repeated `npm run rebuild` runs should not rewrite files.

Report hashes: REPORT\_HASHES.txt pins the DOCX, PDF, and data/checksums.json hashes separately to avoid circular hashing.

Royalty proof boundary: royalties remain matched likely royalties based on same-transaction receipt evidence, not definitive marketplace royalty attribution.

Lock proof boundary: source/tests and deployed-state reads support the lock documentation, while deployed bytecode/source equivalence remains explicitly not verified by this repo.
